1. Introduction

1.1. Purpose

This document provides end users guidance on usage of the ONDA Open Data Protocol (OData) API, exposed by the Catalogue, which allows interactive data discovery and download, via computer programs/scripts.

1.3. Structure of the document

This document is composed of the following sections:

- **Section 1** is this Introduction.
- **Section 2** contains an overview of what the Open Data Protocol (OData) is, a description of the Entity Data Model (EDM) and its Entities.
- **Section 3** provides a description of the ONDA OData Entity Data Model, its Entities and related Properties.
- **Section 4** provides the basic criteria to build an OData query by means of different filters.
- **Section 5** contains an exhaustive list of examples to use the ONDA OData API exposed by the Catalogue. Beginners to OData can also leverage this Section as a structured way to learn.

2. Open Data Protocol overview

OData (Open Data Protocol) is a standard that defines conventions, rules and formats for handling data on the web using Hypertext Transfer Protocol (HTTP/HTTPS) requests.

OData is based on the Representational State Transfer (REST) architecture, which allow resources – identified using Uniform Resource Identifiers (URIs) – to be published and edited by Web clients using simple HTTP messages. The OData specification defines a set of rules for constructing URIs to identify the data and metadata exposed by an OData server as well as a set of reserved URI query string operators.

In the case of the ONDA, the OData interface exposed by the Catalogue allows browsing, selecting and downloading of EO products in the Catalogue itself.

2.1. Entity Data Model concept

This Section provides a high-level description of the Entity Data Model (EDM): the abstract data model that must be used to describe the data exposed by an OData service.

The main concepts in describing the structure of data in EDM are depicted in Figure 1 and described in the following paragraphs.
As we will see in detail in this Section, the EDM organizes entities into a simple hierarchy. Each entity is part of an entity set (2.1.2), and each entity set belongs to an entity container. Entities, each of which is of some entity type (2.1.1), also have a simple structure: they contain properties, each of which contains data that this entity holds. To describe the data in properties, the EDM defines a variety of data types, such as String, Boolean, Int16, Int32, Binary and DateTime. Special properties – called navigation properties – represent associations and implement connections between entities.

2.1.1. Entity Type

An Entity Type is the fundamental building block for describing the structure of data in the EDM. Entity types represent a specific type of data.

Each Entity Type comprises:

- a unique name
- a unique key (for uniquely identifying instances of Entity Types and allowing Entity Type instances to participate in relationships)
- data in form of Properties
- Navigation Properties (optional)

2.1.2. Entity Set

EntitySets are collections of instances of EntityTypes. Each instance of an entity within an entity set can be accessed by its unique key.
3. ONDA OData Entity Data Model

This Section specifies the ONDA OData Entity Data Model. The current version of the ONDA OData service is based on OData v4.0 [RD-1].

3.1. ONDA Entity Types

Each Entity and its properties are listed in the Tables of the following paragraphs.

3.1.1. Product

<table>
<thead>
<tr>
<th>EntityType name</th>
<th>Description</th>
<th>Corresponding EntitySet name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product</td>
<td>The Product Entity represents the fundamental data element which can be managed by the ONDA.</td>
<td>Products</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Properties</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Id (key)</td>
<td>guid</td>
<td>Unique identifier of the Product.</td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td>Product Name</td>
</tr>
<tr>
<td>CreationDate</td>
<td>DateTimeOffset</td>
<td>Time the Product was archived</td>
</tr>
<tr>
<td>Offline</td>
<td>Boolean</td>
<td>Status of the product</td>
</tr>
<tr>
<td>Size</td>
<td>Int64</td>
<td>Size of the Product</td>
</tr>
<tr>
<td>Pseudopath</td>
<td>String</td>
<td>Virtual path used to classify the product in ENS filesystem.</td>
</tr>
<tr>
<td>Footprint</td>
<td>String</td>
<td>Footprint (polygon or multi-poly)</td>
</tr>
<tr>
<td>Quicklook</td>
<td>Binary</td>
<td>Quicklook of the product (if available)</td>
</tr>
<tr>
<td>Downloadable</td>
<td>Boolean</td>
<td>Status of downloadability</td>
</tr>
</tbody>
</table>

3.1.2. Metadata

<table>
<thead>
<tr>
<th>EntityType name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata</td>
<td>The Metadata Entity contains the full set of metadata (attributes) extracted at ingestion time for each specific mission (e.g. Sentinel-1, Sentinel-2, Sentinel-3, etc)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Properties</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID (key)</td>
<td>String</td>
<td>Unique ID of the Metadatum (=name)</td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td>Name of the Metadatum</td>
</tr>
<tr>
<td>Value</td>
<td>String</td>
<td>Value of the Metadatum (if present)</td>
</tr>
</tbody>
</table>

Nested Entity
The following link refer to the lists of all the Metadata nested properties of the Product entity Type (see Paragraph 3.1). These properties change depending on the Product mission.

- Metadata Index S1: see [RD-2],
- Metadata Index S2: see [RD-3],
- Metadata Index S3: see [RD-4],
- Metadata for Envisat products: see [RD-5],
- Metadata for Copernicus Land products: see [RD-6],
- Metadata for Copernicus Marine products: see [RD-7],
- Metadata for Landsat-8: see [RD-8].

### 3.2. ONDA Entity Sets

The entity sets are divided in two categories:

- The **top-level EntitySets**, contained in the highest framework. These entity sets are accessible with the following query:
  
  ```
  https://[ONDA_Catalogue_Hostname]/dias-catalogue/EntitySet
  ```

- The **nested EntitySets**, accessible via an association starting from a top level Entity Set. The OData query described above does not recognize entities that are nested within other entities. This Entity Set can be explored through the "parent" Entity Set by means of the key property.

<table>
<thead>
<tr>
<th>ONDA entity set</th>
<th>Entity set level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Products</td>
<td>First level</td>
</tr>
<tr>
<td>Metadata</td>
<td>Nested</td>
</tr>
</tbody>
</table>
4. How to create ONDA OData queries

In this Section we describe the rules for constructing URIs allowing access to data Entities and Properties listed in Section 0.

The general scheme summarizing the URI components is depicted in Figure 2.

Figure 2 – URI components scheme

A URI used by an OData service has up to three significant parts:

- The service root (Scheme+Host:Port+ServiceRoot);
- The resource path;
- The query string options.

For Example:

```
http://catalogue.onda-dias.eu/dias-catalogue/Products?$top=1000&$skip=29000
```

The service root URI identifies the root of an Odata service. For the ONDA Odata interface, the Scheme is the protocol HTTPS, Host represents the ONDA server IP address or hostname [ONDA_Catalogue_Hostname]).

The ResourcePath identifies the resource to be interacted with and enables any aspect of the data model exposed by an Odata service to be addressed. For the ONDA interface, it is Products.

QueryOptions are additional parameters for the query which specify which data are returned and how they are formatted. We will analyse the query options in the Section 4.1, in order to help the user go through the most common and useful scenarios.

4.1. Query string options

OData supports various kinds of query options for querying data. System query options are query string parameters that control the amount and order of the data returned for the resource identified by the URL. The names of all system query options are prefixed with a dollar character, ($). A query string starts with a question mark (?), and the query options are separated by an ampersand (&). The asterisk (*) is used to specify all values. Each query option can be set on a particular value with (=).
A query string option (QueryOption of Figure 2) can be represented in this way:

\( \$query\_option\_A{=}value\_1\&…\&\$query\_option\_N{=}value\_2 \)

The query options admitted by the Data Hub service are listed in the following Table:

<table>
<thead>
<tr>
<th>Query Option</th>
<th>Description</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>$top</td>
<td>determines the maximum number of records to return</td>
<td>Section 0</td>
</tr>
<tr>
<td>$skip</td>
<td>requests the number of items in the queried collection that are to be skipped and not included in the result</td>
<td>Section 0</td>
</tr>
<tr>
<td>$count</td>
<td>allows clients to request a count of the matching resources included with the resources in the response.</td>
<td>Section 4.1.3</td>
</tr>
<tr>
<td>$select</td>
<td>specifies a subset of properties to return /allows clients to requests a specific set of properties for each entity</td>
<td>Section 4.1.4</td>
</tr>
<tr>
<td>$format</td>
<td>specifies the HTTPS response format e.g. XML or JSON /allows clients to request a response in a particular format</td>
<td>Section 4.1.5</td>
</tr>
<tr>
<td>$search</td>
<td>restricts the result to include only those entities matching the specified search expression. The definition of what it means to match is dependent upon the implementation.</td>
<td>Section 4.1.7</td>
</tr>
</tbody>
</table>

### 4.1.1. Query option $top

A data service URI with a $top System Query Option identifies a subset of the Entities in an EntitySet identified by the Resource Path section of the URI.

This subset is formed by selecting only the first M items of the set, where M is an integer greater than or equal to zero specified by this query option. If a value less than zero is specified, the URI should be considered malformed.

**Syntax:**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$top=<M>

**ONDA example:**

List the last 10 Sentinel-1 products published on the ONDA Catalogue:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="name:S1"&$top=10
4.1.2. Query option $skip

A data service URI with a $skip System Query Option identifies a subset of the Entities in an EntitySet identified by the Resource Path section of the URI.

That subset is defined by seeking N Entities into the EntitySet and selecting only the remaining Entities (starting with Entity N+1). N is an integer greater than or equal to zero specified by this query option. If a value less than zero is specified, the URI should be considered malformed.

The syntax is:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$skip=<N>

A client can request a particular page of items by combining $top and $skip.

4.1.3. Query option $count

The $count system query option allows clients to request a count of the matching resources included with the resources in the response.

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/EntitySet/$count

ONDA example:

Total number of all products in the ONDA Catalogue:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count

Total number of Sentinel-2 products in the ONDA Catalogue:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="name:S2"

4.1.4. Query option $select

The $select system query option allows the clients to requests a limited set of properties for each entity. The value of a $select System Query Option is a comma-separated list of selection clauses.

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Entity?$select=Property_1[,Property_2]

ONDA example:

Querying the ID property of all the Products

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$select=id

Querying the Name and CreationDate properties of all the Products

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$select=name,creationDate
4.1.5. Query option $format

The $format system query option allows clients to request a response in a particular format. The default format is XML. Valid values for the $format query string option are:

- atom,
- xml,
- json

**ONDA example:**

Display all products in the archive in Json format:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$format=json

Display all products in the archive in XML format:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$format=xml

4.1.6. Query option $orderby

The $orderby system query option allows clients to request resources in either ascending or descending order.

**Syntax:**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Entity?$orderby=property [asc|desc]

**ONDA example:**

Querying product sorted by ascending creation date

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$orderby=creationDate%20asc

4.1.7. Query option $search

A URI with a $search System Query Option identifies a subset of the Entities from an EntitySet identified by the Resource Path section of the URI. The subset is determined by selecting only the Entities that satisfy the predicate expression specified by the query option.

**Syntax:**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Entity?$search="<keyword>:<values> [AND <keyword>:<value>]"

Depending on the keyword, the value(s) can be specified as a single value or range of values. Search keywords can be combined with each other using Operators.

**ONDA example:**

Querying Products in a specific creation date range

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Entity?$search="creationDate:[2020-01-01 to 2021-12-31]"
A URI with a $filter System Query Option identifies a subset of the Entities from an EntitySet identified by the Resource Path section of the URI. The subset is determined by selecting only the Entities that satisfy the predicate expression specified by the query option. OData supports a set of basic predicates and built-in functions for $search, including operators. They are described in the following Paragraphs.

### 4.1.8. Query option $filter [To be implemented]

### 4.1.9. Built-in functions [To be implemented]

A set of functions is defined for use with $filter system query option. The following Table describes these OData functions, specifying the ones that are available in the current ONDA version.

<table>
<thead>
<tr>
<th>String functions</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>substringof</td>
<td>bool substringof(string p0, string p1)</td>
<td>The substringof function returns records with names containing a particular string at any position.</td>
</tr>
<tr>
<td>endswith</td>
<td>bool endswith(string p0, string p1)</td>
<td>The endswith function returns true if the first parameter string value ends with the second parameter string value, otherwise it returns false.</td>
</tr>
<tr>
<td>startswith</td>
<td>bool startswith(string p0, string p1)</td>
<td>The startswith function returns true if the first parameter string value starts with the second parameter string value, otherwise it returns false.</td>
</tr>
</tbody>
</table>

### 4.1.10. Operators

The operators supported in the expression language are shown in the following table, specifying the ones that are available in the current ONDA version.
<table>
<thead>
<tr>
<th>Operator</th>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Logical operators</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Equals</td>
<td>eq</td>
<td>The eq operator returns true if the left operand is equal to the right operand, otherwise it returns false. The null value is equal to itself, and only to itself.</td>
</tr>
<tr>
<td>Not equals</td>
<td>ne</td>
<td>The ne operator returns true if the left operand is not equal to the right operand, otherwise it returns false. The null value is not equal to any value but itself.</td>
</tr>
<tr>
<td>Greater than</td>
<td>gt</td>
<td>The gt operator returns true if the left operand is greater than the right operand, otherwise it returns false. If any operand is null, the operator returns false. For Boolean values true is greater than false.</td>
</tr>
<tr>
<td>Greater than or equal</td>
<td>ge</td>
<td>The ge operator returns true if the left operand is greater than or equal to the right operand, otherwise it returns false. If only one operand is null, the operator returns false. If both operands are null, it returns true because null is equal to itself.</td>
</tr>
<tr>
<td>Less than</td>
<td>lt</td>
<td>The lt operator returns true if the left operand is less than the right operand, otherwise it returns false. If any operand is null, the operator returns false.</td>
</tr>
<tr>
<td>Less than or equal</td>
<td>le</td>
<td>The le operator returns true if the left operand is less than or equal to the right operand, otherwise it returns false. If only one operand is null, the operator returns false. If both operands are null, it returns true because null is equal to itself.</td>
</tr>
<tr>
<td>And</td>
<td>and</td>
<td>The and operator returns true if both the left and right operands evaluate to true, otherwise it returns false. The null value is treated as unknown, so if one operand evaluates to null and the other operand to false, the and operator returns false. All other combinations with null return null.</td>
</tr>
<tr>
<td>Or</td>
<td>or</td>
<td>The or operator returns false if both the left and right operands both evaluate to false, otherwise it returns true. The null value is treated as unknown, so if one operand evaluates to null and the other operand to true, the or operator returns true. All other combinations with null return null.</td>
</tr>
<tr>
<td>Not</td>
<td>not</td>
<td>The not operator returns true if the operand returns false, otherwise it returns false. The null value is treated as unknown, so not null returns null.</td>
</tr>
<tr>
<td>Wildcard</td>
<td>*</td>
<td>any sequence of zero or more characters</td>
</tr>
</tbody>
</table>
5. ONDA OData queries by examples

This Section contains an exhaustive list of examples to query and filter Entities and Properties, and therefore can be used as a "beginner user manual".

5.1. Querying all the Entities of the ONDA OData API

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/

Response Payload:

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```xml
  <app:workspaces>
    <atom:Ens_Container atom:atom>
      <app:collection href="/metadatas" metadata:name="Metadatas">
        <atom:atom:Title/>
      </app:collection>
    </atom:Ens_Container>
  </app:workspaces>
</app:service>
```

5.2. Querying products in the Catalogue

The following OData URI returns all the products stored in the ONDA Catalogue. Each product record includes the Id, the product name and its properties, the link for download and the link to metadata.

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products

By default it provides a list of 100 records sorted by creation date and arranged in descending order.

5.3. Querying Products, showing all Metadata together with their Properties

The following OData URI returns all the products stored in the ONDA Catalogue, with their properties, and showing also all their Metadata in the response payload.

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$expand=Metadata

Using $skip and $top options, it is possible to choose how many products are requested.
5.4. Querying Products, showing all the Properties (but not the quicklook) and Metadata:

It is also possible to show, together with all the Metadata, only a subset of chosen Properties, specifying which of them.

For example:

```
https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$expand=Metadata&$select=id,name,creationDate,beginPosition,offline,size,pseudopath, footprint,downloadable
```

5.5. Querying a single Product in the archive

Syntax:

```
https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(Id)
```

For example:

```
https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(1307ac04-597e-4b97-8812-81fa52d6bd1a)
```

The request returns an individual entity of type Product by the given Id '1307ac04-597e-4b97-8812-81fa52d6bd1a'
5.6. Search product metadata

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(Id)/Metadata

For example:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(1307ac04-597e-4b97-8812-81fa52d6bd1a)/Metadata

The request returns all the metadata of the Product identified by the Id ‘1307ac04-597e-4b97-8812-81fa52d6bd1a’.

5.7. Search a specific metadatum

Syntax:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(Id)/Metadata('metadatum')

For example:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(30d01828-1b55-44a0-93a2-27c03a0e324b)/Metadata('beginPosition')

The request returns the specific ‘beginPosition’ metadatum of the Product identified by the Id ‘30d01828-1b55-44a0-93a2-27c03a0e324b’.

5.8. Querying the products (paging)

The URI to be used for paging the list of products in the archive shall follow the syntax below:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$skip=<N>&$top=<M>

where $skip=<N> is the number of records to skip before it retrieves records in a collection and $top=<M> is the maximum number of records to return.

Example:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$skip=10&$top=50

this OData URI allows to list 50 products skipping the first 10.

5.9. Filter the products on time-based criteria

5.9.1. Filtering the Products by Creation date

Example:

Select products created from 10 of May 2018 00:00:00

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="creationDate:[2018-05-10T00:00:00Z%20TO%207]"
5.9.2. Filtering the Products by Sensing Time (start and stop)

The keywords that can be used to filter products on sensing time are:

- **beginPosition**: a time interval search based on the Sensing Start Time of the products.
- **endPosition**: a time interval search based on the Sensing Stop Time of the products.

Example:

Search every products having sensing from 1 of May to today

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="beginPosition:[2018-05-01T00:00:00.000Z%20TO%202018-06-01T00:00:00.000Z]"

Count every products having sensing from 1 of May to 1 of June 2018

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="beginPosition:[2018-05-01T00:00:00.000Z%20TO%202018-06-01T00:00:00.000Z]"

Search every products having sensing in the last day

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="beginPosition:[NOW-1DAY TO NOW]"

Search every products ingested in the last month

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="beginPosition:[NOW-30DAYS TO NOW]"

Search every products ingested in the last hour

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="beginPosition:[NOW-1HOUR TO NOW]"
5.10. Filtering the Products using the file name

The products file name can be used for filtering the products. It shall be noticed that this query criteria is not based on the Metadata indexed from the products content but the criteria is search products matching a predefined string on the file name.

Select the S1 products:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="name:S1*"

Select the S1A products:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="name:S1A*"

Select the last 15 S1A products on the ONDA Catalogue:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="name:S1A*"&$top=15

Select a specific product by its name:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="name:S1A_IW_OCN__2SDV_20170904T063918_20170904T063943_018222_01EA1A_8E10.zip"

5.11. Download full product from its ID

To download a product the syntax is:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(Id)/$value

Example:

Download product identified by Id ‘00c093ff-b140-41ac-8ebd-1227f643466c’

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products(00c093ff-b140-41ac-8ebd-1227f643466c)/$value

Note: users will be requested to sign in to start the download. Attention should be paid to the fact that Username and Password are the same used to access the ONDA User Portal.

5.12. Sort products by creation date

Example:

Querying product sorted by descending creation date

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$orderby=creationDate%20desc
5.13. Search products with specific metadata

Here some examples of queries to search products with specific metadata.

**Search products with cycle number equal to 10**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="cycleNumber:10"

**Count products with cycle number between 1 to 60**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="cycleNumber:[1%20TO%2060]"

**Search products with last orbit direction descending**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="lastOrbitDirection:DESCENDING"

**Count products with orbit number between 0 and 8000**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products/$count?$search="orbitNumber:[0%20TO%208000]"

**Search products with cloud cover percentage between 0 and 70**

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="cloudCoverPercentage:[0%20TO%2070]"

5.14. Discover the products over a predefined Area Of Interest (AOI): Geographical Search

It is possible to search products on the basis of a geographical area of interest, e.g. get the list of products over a geographic area delimited by the polygon having vertices:

https://[ONDA_Catalogue_Hostname]/dias-catalogue/Products?$search="footprint:"Intersects(<geographic type>)"

The `<geographic type>` value can be expressed as a polygon according to the syntax described in the following paragraph.

5.14.1. POLYGON

The syntax for the `<geographic type>` value expressed as a polygon is:

<geographic type> =POLYGON((P1Lon P1Lat, P2Lon P2Lat, …, PnLon PnLat, P1Lon P1Lat))

where P1Lon and P1Lat are the Longitude and Latitude coordinates of the first point of the polygon in decimal degrees (DDD) format (e.g. 2.17403, 41.40338) and so on.
The coordinates of the last point of the polygon must coincide with the coordinates of the first point of the polygon.

The polygon describing the geographical area can have a maximum of 200 points that must be within the area defined by (180/85, -180/-85).

Example:

Search every products having polarization mode VV covering the geographic area delimited by the polygon having vertices:

```
```
